

Capstone Week 10 – Launch, Demo & Story

Purpose

This document defines a repeatable process for adding future portfolio case studies, identifies the next project to publish, records a recurring reminder strategy, and preserves the build context so future updates are fast and consistent.

How to Add the Next Case Study

Problem: State the real-world challenge and target users.

What I Did: Explain my role, architecture, AI models, tech stack, design decisions, implementation, testing, and deployment.

Outcome: Present measurable results, screenshots, GitHub, live demo, lessons learned, and future improvements.

Standard Workflow

1. Finish the project and validate results.
2. Capture polished screenshots and demo GIF/video.
3. Push code to GitHub with README.
4. Deploy the application.
5. Write the case study using the three-beat structure.
6. Add links to portfolio and homepage.
7. Publish and share on LinkedIn.

Next Named Project

AI Agent Marketplace – A production-ready platform for discovering, launching, managing, and evaluating specialized AI agents with authentication, dashboards, analytics, and deployment.

Reminder Evidence

Recurring reminder: Every Sunday at 7:00 PM. Title: 'Update Portfolio with Latest Case Study'.

Purpose: review completed work, publish one new case study, refresh screenshots, deployment links, and documentation. (Attach a screenshot of your calendar reminder with this PDF during submission.)

Build Context Preserved

My Claude Project is retained as the long-term build context. It contains my writing style, portfolio identity kit, technology stack, UI preferences, project templates, and case study format, allowing new portfolio entries to be produced efficiently without rebuilding context.

Commitment

I will update my portfolio after every meaningful project so it remains a living record of my engineering growth rather than a static class artifact.
