

Portfolio Framed Cases

Prepared for Internship Submission

Voice Card

Clear • Practical • Honest • Technical • No Buzzwords

Standing Instruction for Claude

Always write in my voice: clear, practical, honest, and technical. Use my own experiences and decisions. Do not exaggerate achievements, invent metrics, or use marketing buzzwords. Focus on explaining the problem, the decisions I made, and what I learned.

How I Approach My Work

My goal is to build projects that solve practical problems while helping me improve as an AI engineer. I prefer explaining why I made technical decisions instead of only listing technologies. Each project below follows the same structure: the problem, what I built and why, and the outcome.

Bio

I'm Vinay Kumar, a B.Tech student in Artificial Intelligence and Machine Learning. My interests include machine learning, AI automation, retrieval-augmented generation (RAG), and intelligent web applications. Most of my projects are learning-focused, where I experiment with modern AI tools, automate workflows, and turn ideas into working applications. I value practical learning, continuous improvement, and writing software that is understandable and useful.

AI Research Assistant

Problem

Reading long PDFs and websites is time-consuming. I wanted to create a tool that lets users upload content and ask questions naturally instead of manually searching documents.

What I Did & My Decisions

I designed a workflow where users upload documents, embeddings are created, and relevant information is retrieved before generating responses with an LLM. I chose this architecture because it scales better than sending entire documents to the model. Building it improved my understanding of RAG systems, embeddings, and prompt design.

Outcome

The project demonstrated how modern AI can make document search conversational. It strengthened my understanding of retrieval pipelines and gave me practical experience integrating AI into a real application.

Dental Lead Automation

Problem

Dental clinics often receive enquiries manually, making follow-up inconsistent and time-consuming.

What I Did & My Decisions

I built an automation workflow that validates enquiries, stores leads, classifies submissions, and sends confirmation emails through an automated pipeline. I manually tested successful submissions, invalid inputs, and failure scenarios to verify the workflow.

Outcome

The project helped me understand end-to-end automation, webhook integrations, testing, and designing reliable workflows.

AI Resume Analyzer

Problem

Recruiters spend significant time reviewing resumes, while candidates struggle to identify missing skills.

What I Did & My Decisions

I developed a resume analysis application that extracts resume content and provides AI-generated feedback on skills, strengths, and areas for improvement. I focused on making the feedback understandable instead of overly technical.

Outcome

This project improved my understanding of document processing, prompt engineering, and building AI-powered productivity tools.

Portfolio Website

Problem

I wanted a portfolio that explains my work instead of only displaying screenshots.

What I Did & My Decisions

I built a responsive portfolio highlighting projects, skills, and case studies. I emphasized clean navigation and concise project descriptions that explain both technical implementation and decision-making.

Outcome

The portfolio became a central place to present my learning journey and showcase practical AI projects.

Contact / Call to Action

Thank you for reading my portfolio. If you would like to discuss AI, machine learning, automation, internships, or future collaborations, I would be happy to connect through LinkedIn, GitHub, or email.

Before vs After

Before (Generic AI)

I am a results-driven AI developer passionate about leveraging cutting-edge technologies to deliver innovative solutions.

After (My Version)

I build AI projects to understand how modern systems work and solve practical problems. I enjoy experimenting with machine learning, automation, and intelligent applications, and I continuously improve each project as I learn.
