

Week 01 – Portfolio Sitemap Assignment

Name: Vinay Kumar

Program: B.Tech Artificial Intelligence & Machine Learning

Date: July 10, 2026

One Action

My primary goal is to encourage recruiters and hiring managers to contact me for AI/ML Internship and Machine Learning Engineer opportunities.

Proof Statement

I build practical Machine Learning applications using Python, scikit-learn, Streamlit, and FastAPI. My portfolio demonstrates real projects, internship work, and continuous learning that showcase my ability to solve real-world AI problems.

Portfolio Sitemap

The portfolio will contain only the essential pages needed to support my proof statement and guide visitors toward contacting me.

- **Home** – Introduces who I am, what I build, and my value proposition.
- **Projects** – Highlights my machine learning projects with detailed case studies.
- **About** – Provides a brief introduction, technical skills, education, and career goals.
- **Contact** – Allows recruiters and collaborators to connect with me.

Figure 1:

Claude Project

Project Name: Portfolio Build – AI/ML Engineer

The Claude Project was configured with custom instructions based on my proof statement. The project is designed to act as a tutor by reviewing ideas, providing constructive feedback, identifying weaknesses, and suggesting improvements throughout the portfolio-building process.

Figure 2:

What's working

Home → Projects → About → Contact is the right *skeleton*. Recruiters scan, they don't read, so a shallow site is actually an advantage — if the content on each page is dense with proof. The risk isn't that you have too few pages; it's that "Projects" and "About" are being asked to carry weight they can't carry alone.

What's missing

- 1. A dedicated "Skills" or "Tech Stack" page (or a very structured section)**

Right now your stack (Python, scikit-learn, Streamlit, FastAPI) only appears in your proof statement. Recruiters — and the ATS bots before them — scan for keyword-matchable skills fast. Don't bury this inside prose on the About page. Give it its own visible, scannable block: languages, ML libraries, deployment tools, and *what you can build with each*, not just a list of logos.
- 2. Individual Project Detail pages (not just a Projects grid)**

A single "Projects" page showing thumbnails is a gallery, not evidence. Recruiters who click through want a mini case-study per project:

 - Problem → Approach → Model/Architecture → Results (metrics!) → What you'd improve next
 - Link to live demo (Streamlit) + GitHub repo

This is the single highest-leverage addition. A project with no metrics ("built a churn predictor") is a claim. A project with metrics ("reduced false negatives by 18% using SMOTE + XGBoost, deployed via FastAPI") is proof.

- 3. Resume as a first-class, one-click artifact**

Not buried in Contact. A visible "Download Resume" button in the nav or Home hero. Recruiters often want the PDF to forward internally — don't make them hunt.
- 4. A "Blog / Notes / Learning Log" page — optional but high-signal**

This is what differentiates "continuous learning" (your proof statement claims it) from a static project dump. Even 3–4 short posts ("What I learned deploying scikit-learn with FastAPI," "Debugging a data leakage bug") show active thinking, not just finished output. If you don't have bandwidth to maintain this, cut the claim from your proof statement instead of leaving it unproven.

What's unnecessary or needs cutting

- "About" as a generic bio page is often where portfolios go soft — a paragraph of hobbies and a photo. Recruiters don't care about your life story; they care about *why you're credible for this role*. Reframe About into: your internship experience, your learning trajectory (bootcamp/courses/certs), and a short "how I work" — not a personal narrative.
- Contact as a plain form is often ignored. Recruiters prefer LinkedIn/email direct links over filling a form that might not even send correctly. A form is fine as a backup, but the primary CTA should be a `mailto:link + LinkedIn + GitHub`, visible in the footer of every page, not just on a dedicated Contact page.

Revised sitemap

Home (hero + proof statement + top 2 projects + resume CTA)
Projects (grid) → Project Detail pages (case-study format, 3-5 projects)
Skills (stack, categorized, framed by capability not just logo list)
About (experience/internship + learning trajectory – not a bio)
Blog/Notes (optional, 3+ posts if you can commit to it)
Contact (email/LinkedIn/GitHub, form optional)

Pressure-Test Prompt

Prompt Used

I am building a portfolio for AI/ML internship and placement opportunities.

My proof statement is:

"I build practical Machine Learning applications using Python, scikit-learn, Streamlit, and FastAPI."

My sitemap is:

- Home
- Projects
- About
- Contact

Please pressure-test this sitemap. Identify any missing sections, unnecessary pages, and suggest improvements that would better convince recruiters to contact me.

Figure 3:

Change I Will Make

Based on Claude's feedback, I will improve my **Projects** section by presenting each project as a complete case study. Each case study will include the problem statement, dataset, approach, technologies used, implementation details, results, challenges faced, and key lessons learned. This will provide stronger evidence of my practical AI and Machine Learning skills.

Conclusion

This assignment helped me design a focused portfolio that supports a single objective: encouraging recruiters to contact me for AI/ML opportunities. By limiting the portfolio to only the most important pages and using Claude as a tutor to review the structure, I can create a clearer, more effective portfolio that demonstrates my skills through real projects and case studies.
